

## TITLE

**SYSTEM FOR CONTROLLING REMOTE APPARATUSES**

## ABSTRACT

System for controlling remote apparatuses following the  
5 reception of a specific message, consisting of a sequence of  
characters initially defined by the user, to activate  
special procedures, for example a reset procedure that  
returns the program of the entire apparatus to a known  
initial status. The remote apparatus sends a feedback  
10 message to the supervising apparatus confirming that the  
reset operation has been performed. It can be achieved by  
means of a specific circuit or by integrating the circuit in  
new versions of microprocessors or microcontrollers to be  
marketed.
